

The earthquake in Turkey

In the last few weeks, a massive earthquake hit Turkey and has already killed hundreds of people and completely destroyed whole cities. We are going to be looking at what caused the earthquake, and why it was so destructive.

What caused it?

The Earth's crust is made up of several plates, and one of them (in our case the Arabian plate) started moving to the north and hit the Anatolian plate, which caused pressure and led to movement on the surface of Earth. As it is described in the picture, the earthquake was caused by a strike-slip fault.

USA shooting down UFOs?!

On the 4th February, in the sky above Myrtles Beach appeared an unidentified flying object. The USA shot it down and then they discovered it was a Chinese surveillance balloon. China admitted that the balloon was theirs. On 10th February another object appeared, now in Alaska. They took it down as well, but now we only know it was a "car size object", but that's about it. The very next day, another UFO emerged, now on the border of the USA and Canada. Both countries worked together to take the object down. Canada said that they will analyze the wreck. Canada commented that it was a "cylindrical object" but again, that is all. On yet another day, on 12th February one last UFO was seen in the sky, it was yet again shot down. The USA was asked if they reacted properly by shooting everything down and they responded that due to information they had at that moment, it was a proper reaction.
